Tanning, chemical treatment of raw animal hide or skin to convert it into leather. A tanning agent displaces water from the interstices between the protein fibres and cements these fibres together. The three most widely used tanning agents are vegetable tannin, mineral salts such as chromium

Tanning | leather manufacturing | Britannica

Globally, approximately 80% of all leather is tanned using the chrome tanning method and 10 - 12% using the vegetable tanning process. The type of tanning method can be identified by the colour of the leather (before colouring and before finishing). If vegetable tanned, the leather is brown. If tanned with fats or oils, it is yellowish.

Leather Tanning Process - YouTube

Tanning is the process of treating skins and hides of animals to produce leather. A tannery is the place where the skins are processed. Tanning hide into leather involves a process which permanently alters the protein structure of skin, making it more durable and less susceptible to decomposition, and also possibly coloring it. Before tanning, the skins are dehaired, degreased, desalted and soaked in water over a period of six hours to two days. Historically this process was considered a noxious
