Analytical methods such as the preceding ones are elegant and relatively easy to use, but they are restricted in their applicability by the validity of the assumptions used to derive the equations. The two most restrictive assumptions concern the zero-order kinetics and the lack of remineralization.

Methods in biochemistry. Like other sciences, biochemistry aims at quantifying, or measuring, results, sometimes with sophisticated instrumentation. The earliest approach to a study of the events in a living organism was an analysis of the materials entering an organism (foods, oxygen) and those leaving (excretion products, carbon dioxide). This is still the basis of so-called balance experiments conducted on animals, in which, for example, both foods and excreta are thoroughly analyzed.
