Policy V 107  
demonstrates how to  
effectively use numerical  
modeling to predict the  
effects of food processing  
on targeted components. This  
non-destructive testing  
method virtually eliminates  
the health risks of under-  
processed food and maintains  
high nutritional values that  
are often lost in overcooked  
food.

It is used for many different purposes, including process design and process optimization.

However, modeling goes beyond the process and can include applications to understand and optimize food storage and the food supply chain, and to perform a life cycle analysis. Operations Modeling by  
Joseph M . . .

Modeling, particularly numerical and observational models of food processes, has come a long way and has become an integral part of research and design.

Although analytical models were the main mode of modeling before the days of faster computers, computer-based numerical and empirical models are the primary types of models in development today.
