 Using jythonc A script called jythonc should have been installed in the Jython installation directory when you installed the package. If it was not, it can be invoked as follows: jython Tools\jythonc\jythonc.py. The jythonc tool generates actual Java source code, and then invokes a Java compiler over this source code to create the.class files.

 You can use the Jython Evaluator processor to read, update, or create record header attributes. Use a map when creating or updating a header attribute. If a header attribute exists, the script updates the value. If it does not exist, the script creates the attribute and sets it to the specified value.

 Jython has a known issue with the thread safety of imports. To work around this issue, you can use a system-wide lock available with the Jython Scripting origin to synchronize imports between threads and between pipelines. In your script, acquire the lock, import all needed modules, and then release the lock.

 Compiling (for debugging)¶ CPython provides several compilation flags which help with debugging various things. While all of the known flags can be found in the Misc/SpecialBuilds.txt file, the most critical one is the Py_DEBUG flag which creates what is known as a "pydebug" build. This flag turns on various extra sanity checks which help catch common issues.
