Stress And Strain Lecture

Analysis of how forces are distributed in a 2D or 3D body, from which emerges the idea of a stress tensor. (Strain is also a tensor – whatever that means!) Just like forces are related to displacements in 1D, we will seek to relate the kinematic quantities (strain and its rates) to forcing quantities, such as stress.

Concept of strain : if a bar is subjected to a direct load, and hence a

Read Online Lecture 7

Stress And Strain Lecture

When a bar is subjected to stress, the bar will change in length. If the bar has an original length L and changes by an amount dL , the strain produced is defined as follows: Strain is thus, a measure of the deformation of the material and is a nondimensional quantity i.e. it has no units.
