Leah4sci 6 Comments. In Organic Chemistry,

synthesis and retrosynthesis go hand in hand.

While there isn't a clear distinction, I like

to think of synthesis as forward thinking and

retrosynthesis as the reverse. Synthesis is a

topic that is typically introduced in Organic

Chemistry 1, right after studying alkyne

reactions.

A large part of organic chemistry involves

building more complex molecules from smaller

ones using a designed sequence of reactions,

i.e. chemical synthesis. Especially in more

complex cases, synthetic problems are often

best solved backwards in a process known as

retrosynthetic analysis.

It is an analytical technique used in which the deconstruction or fragmentation of targeted organic molecule is done to produce starting material, generally called as "synthon". Fragments generated via a particular pattern of break down. It is called as retro synthesis because it is a reversible process of chemical synthesis.

Retrosynthesis is designing a reverse synthesis of the organic compound. This helps us to find the way of synthesis for that compound. Retrosynthesis give us an idea about the synthetic steps of a complex compound as well. Thus by Retrosynthesis, we can convert the target molecule into its simple precursors.

Retrosynthetic analysis is a technique for solving problems in the planning of organic syntheses. This is achieved by transforming a target molecule into simpler precursor structures regardless of any potential reactivity/interaction with reagents. Each precursor material is examined using the same method. This procedure is repeated until simple or commercially available structures are reached. These simpler/commercially

available compounds can be used to form a synthesis of the target molecule.

So let's go ahead and do that, so we're going to break that double bond and add two hydrogens to the alpha carbons, so thinking about this in terms of retrosynthesis, we have a ring here. All right and then let me, let me go ahead and draw this over here.

People often dismiss organic chemistry as "all memorization". I disagree - organic chemistry is just a series puzzles based on a few basic concepts (electronics, sterics, orbitals) that come together to answer almost any problem you might encounter on your homework or tests. One possible exception to this rule is retrosynthesis.

*123.312 Advanced Organic Chemistry: Retrosynthesis*

Synthesis is the process of combining simple reactions to form an organic compound, but retrosynthesis is the process of working backward from the target organic compound to devise a suitable route of synthesis starting from a simple precursor molecule.

*What is the Difference Between Synthesis and Retrosynthesis*

Retrosynthetic analysis is a technique for planning a synthesis, especially of complex organic molecules, whereby the complex target molecule (TM) is reduced into a sequence of progressively simpler structures (retrons) along a pathway which ultimately leads to the identification of a simple or commercially available starting material (SM) from which a chemical synthesis can then be developed.

## *RETROSYNTHETIC ANALYSIS*

Retrosynthesis is the process of thinking backwards in synthesis design. We consider how a given target molecule is made from some precursor molecule, instead of starting with the given starting material. We start by examining the aldehyde target structure. Can it be made in a single step from the given starting material?

Like the first, the second edition is built on ...

## *Organic Chemistry - Jonathan Clayden, Nick Greeves, Stuart ...*

Retrosynthesis is a technique to solve the synthesis of organic compounds. While planning for the synthesis of a complex organic compound in laboratories, chemists usually proceed backward from the final product to reach the starting material using a known reaction pathway.
