When I was tasked with creating a presentation to share with my co-workers at our weekly tech talk, I chose to use LaTeX. While I briefly considered other tools, like Google Slides or PowerPoint, using LaTeX allowed me to easily separate the styling from my content and create my own theme that I could reuse for all future presentations at Lucid.

Cases were defined as patients presenting with absolute field loss within 5 ° of fixation or a cup ...

Each year, almost 11 million children under five years of age die from largely preventable causes, whilst about half a million women die in pregnancy, childbirth or soon after. This year’s report focuses on maternal, newborn and child health issues as an integral part of progress towards achieving the Millennium Development Goals targets and promoting poverty reduction. It identifies exclusion as a key feature of inequity as well as a barrier to progress, and sets out strategies required to ensure universal access to health care and social health insurance systems for every mother and child, through a continuum that extends from pregnancy through childbirth, the neonatal period and childhood.

In 1996, the Institute of Medicine (IOM) released its report Telemedicine: A Guide to Assessing Telecommunications for Health Care. In that report, the IOM Committee on Evaluating Clinical Applications of Telemedicine found telemedicine is similar in most respects to other technologies for which better evidence of effectiveness is also being demanded. Telemedicine, however, has some special characteristics-shared with information technologies generally-that warrant particular notice from evaluators and decision makers. Since that time, attention to telehealth has continued to grow in both the public and private sectors. Peer-reviewed journals and professional societies are devoted to telehealth, the federal government provides grant funding to promote the use of telehealth, and the private technology industry continues to develop new applications for telehealth. However, barriers remain to the use of telehealth modalities, including issues related to reimbursement, licensure, workforce, and costs. Also, some areas of telehealth have developed a stronger evidence base than others. The Health Resources and Service Administration (HRSA) sponsored the IOM in holding a workshop in Washington, DC, on August 8-9 2012, to examine how the use of telehealth technology can fit into the U.S. health care system. HRSA asked the IOM to focus on the potential for telehealth to serve geographically isolated individuals and extend the reach of scarce resources while also emphasizing the quality and value in the delivery of health care services. This workshop summary discusses the evolution of telehealth since 1996, including the increasing role of the private sector, policies that have promoted or delayed the use of telehealth, and consumer acceptance of telehealth. The Role of Telehealth in an Evolving Health Care Environment: Workshop Summary discusses the current evidence base for telehealth, including available data and gaps in data; discuss how technological developments, including mobile telehealth, electronic intensive care units, remote monitoring, social networking, and wearable devices, in conjunction with the push for electronic health records, is changing the delivery of health care in rural and urban environments. This report also summarizes actions that the U.S. Department of Health and Human Services (HHS) can undertake to further the use of telehealth to improve health care outcomes while controlling costs in the current health care environment.

Letter of Credit is the most secure and balanced payment method used in the world, internationally and domestically. It is complex and technical. The most important challenge is reserve. Successful traders trade easily (known or unknown) to every region of the world. We will have understood the reserve issues and applications of rules and letter of credit and we will increase our ability to cope.
