Design of kettle reboiler The Kern method for designing of Kettle reboiler for isothermal boiling is summarized below. It is assumed that the degree of sub-cooling and super-heating of the cold fluid is negligible i.e. vaporization of close boiling compounds with negligible super-heating of vapors formed.

This volume is called condenser hot well and its level (as for the level in the kettle reboilers) is one of the control parameters of a Rankine cycle. The level must be in a well-defined range, between a minimum level in order to prevent pump cavitation and a maximum level that prevents some tubes from remaining submerged, which would result in condensate subcooling and detrimental effects on the efficiency of the plant.

Kettle Reboiler -an overview - ScienceDirect Topics

The defining feature of the Kettle type reboiler is that the tube bundles are placed inside a large specifically designed horizontal shell known as TEMA K-shell. The weir is provided inside the shell in order to control the level of the liquid. The vertical length of the weir dictates what quantity of liquid will be retained in the shell.

Kettle-Type Reboiler Working - Chemical Engineering World

A kettle-type reboiler is similar in design and appearance to the shell and tube exchanger. The commodity to be heated is routed, via pipe, to and from the heater and fractionation column. The thermosyphon reboiler, however, is attached directly to a fractionating column via its nozzles.

This type is used exclusively for kettle reboilers and vaporizers, and is characterized by the oversized shell intended to separate vapor and liquid phases, Fig. 52.8. Shell-sizing relationships are given in Ref. 25. Usually, the shell diameter is about 1.6-2.0 times the bundle diameter. Design should
